Assignment interview questions

1. what is the need of IAM..?

                identity and access management used to regulates access to Aws resources it allows to assign permission to groups of users it helps up to adminstrator defined who can access what on an Aws account

2. Why do we prefer not using root account..?

                if root account credentials are stolen that person will be able to access anything in the account they may misuse any resources in the account it may end in unnecessary cost by creating resources in Aws account

3. How to revoke policy for an IAM user..?

                we can add and remove policy by attaching and detaching IAM for an identity using the Aws management console. In that choose user with the policy that we want remove and choose delete

4. Can a single IAM user be a part of multiple policy via group and root..?

                We can attach multiple policies to an identity and each policy can contain multiple permission. We can attach policy by

- opening aws management console.
- And select user groups after that name of the group

- Select permission and add permission and then choose attach policy

5. If i am a non tech person how will you define policies in IAM.

Policy is the actual document which specifically tells who can perfom which action on what entities. policy says what a user, group, role are allowed to do so a policy should be attached to user, group, role in order to make them useful without a policy a user, group, role is useless
